(5.) Nanocoatings Program	11
b. Demonstration / Validation Programs	12
(1.) Environmental Science and Technology Certification Program	12
(2.) National Defense Center for Environmental Excellence	12
(3.) Casting Emission Reduction Program	13
2. Industrial Ecology Center Staff Directory	15
3. FY02 New Starts	17
Development of Membrane Technology for Food and Water Monitoring	
Computational Model Development for Improved Solid Waste Monitoring	
Nanomachines in Smart Coatings	
4. Green Programs	18
Materials and Processes Partnership for Pollution Prevention (MP4)	
Demanufacturing of Electronic Equip. for Reuse and Recycling (DEER2)	
Sustainable Green Manufacturing (Roll-up)	
Green Gun Barrel (Roll-up)	
Green Bullet (Roll-up)	
5. Project Summaries	22
5. a. Cleaning and Degreasing Projects	22
Aqueous Based Degreasing Technology	
Microbial Cleaning	
5. b. Plating and Finishing Projects	23
Removal of Cyanide-Bearing Processes (NDCEE N.227 Sub-Task 012)	
Physical Vapor Deposition Coatings and Ion Beam Processing (PP-632-94)	
Improving Aluminum Ion Vapor Deposition (NDCEE Task N.227 Subtask 003)	
Environmental Metal Plating Alternatives	
5. b. Plating and Finishing Projects (Continued)	

Non-Line-of-Sight Hard Chromium Alternatives (NDCEE Task N.229)
 Target Technology Development for CMS Deposition
 Elimination of Aqueous Electrodeposition of Chromium for Bore
 Protection of Gun Barrels
 Sodium Hydroxide Recycling System
 Ion Beam Processing for Improved Corrosion Protection (SGM
 Subtask R4-1)
 Membrane Separation Process (SGM Sub-Task R3-3)
 Waste Acid Detoxification and Reclamation
 Investigating Surface Finishing Techniques (SGM Sub-Task R4-3)
 Pollution Prevention Investigation of Chromium Demister at Anniston
 Army Depot (NDCEE Task N.261)
 Ion Beam and Plasma-Based Alternatives to Chrome Plating of Gas
 Turbine Engines
 Spent Acid Recovery (NDCEE Task N.227 Sub-Task 004)
 Electroplating/Cleaning Bath Life Extension
 Laser Induced Surface Improvement for Elimination of VOC's and
 Hazardous Materials in Plating Operations
 Electro-Spark Deposited Coatings for Replacement of Chrome
 Electroplate (on non-line-of-sight surfaces) (SERDP PP-1147-00)
 Surface Treatments for Enhanced Wear Resistance (NDCEE Task
 N.245)
 Facility-Wide Solid Waste Minimization assessment at Anniston
 Army Depot (NDCEE Task N.260)
 In-Situ Study of Phase Evolution in Sputtering
 Non-Chromate Sealers for Aluminum Anodizing (ESTCP 19970)
 Evaluation of Non-Chromate Conversion Coating/Pretreatment
 of Aluminum (NDCEE Task N.008)
 Non-Chromate Pretreatment of Non-Ferrous Metals
 Environmentally Acceptable Non-Line-of-Sight Alternatives to Chrome
 Plate (N.227 Mod 1 SubTask 030)
 Organosilane Based Pre-Treatment
 Advanced Polyelectrolyte Modified Zinc Phosphate Conversion
 System
 Innovative Coating Applications for Miscellaneous Metal Parts
 (NDCEE Task N.047)
 Advanced Zinc Phosphate Metal Pre-Treatment (SERDP PP659-94)
 Self-Assembled Monomers (SAMs) as Primers for Corrosion
 Protection for Metallic Substrates & Spectroscopic Studies of
 Primer Alternatives

5. c. Painting and Coating Process Projects

38

Reduce or Eliminate VOC's in CARC Paint Formulation, Application
 and Removal (SERDP PP1056-97)
 Powder Coating Technology for Small Arms Bullet Tip Identification
 Zippable Potential CARC Paints

5. c. Painting and Coating Process Projects (continued)

Powder Coat Material Investigation for CCAD, NADEP-JAX, RRAD and Other (SGM Subtask R4-1)	39
Corrosion Protective Coatings for DU Penetrators	
Unitized Coating application Facility: E-Coat & Powder Coat (NDCEE Task N.002)	
Paint Handling & Spraying Equipment Testing, Evaluation and Training (NDCEE Task N.023)	
Organic Coating Processes (SGM Subtask R4-1)	
Supercritical CO ₂ Painting Demonstration (SGM Subtask R3-1)	
X-Ray Sorbing/Scattering Structural Characterization (SGM Subtask R4-2)	
Powder Coat Applications (NDCEE Task N.046)	
Evaluation, Qualification and Implementation of Powder Coating for Tobyhanna Army Depot SGM Subtask R4-2)	

5. d. Paint Stripping Projects 45

Waterjet Paint Stripping (NDCEE Task N.004)	
Plasma Based Removal of Organic Coatings	
Tri-Service Dem/Val FLASHJET Process for Military Applications	
Paint Stripping Using CO ₂ Pellets	
Laser Decoating for Missiles	
Zero VOC/HAP Chemical Stripper for Large Aircraft Depainting Operations	
Evaluation of Coatings Removal Technologies with/without Vacuum Recovery on Delicate Substrates	

5. e. Ordnance - Reuse / Recycling Projects 49

Catalytic Hydro treatment of Military Compounds	
Extraction and Recycling of Nitramines With Supercritical Fluids	
Recycling Propellants in Non-Polluting Supercritical Fluids	
Adams Process Evaluation	
Molten Metal Catalytic Extraction Process for Military Specific Hazardous Waste and Munitions	
Recycling of Nitrocellulose Fines	
Extraction/recycling of Triple Base Propellants with Supercritical Fluids	
Full Scale Simulation for Production Process of Energetic Material Using a Twin Screw Extruder	
Fiber Optic Sensors for Manufacturing Facilities	

5. f. Ordnance - Eliminate Toxic Materials Projects 55

Clean Burning Solid Propellants	
Design/Use Catalysts to Avoid Red water in TNT Production	
Develop Non-Polluting Primary Explosives	
Laser Ignition to Replace Chemical Ordnance Igniters	
Eliminate Toxic and VOC Constituents from Small Caliber Ammunition (Green Bullet)	

5. f. Ordnance - Eliminate Toxic Materials Projects(Continued)

Improved CL-20 Manufacturing Process	57
Pink Water Treatment Technology	
Green Ammo – MIC/Primer Scale up (SGM Subtask R2-3)	
Green Ammo – TNAZ (SGM Subtask R2-4)	
Environmentally Friendly Process for The Preparation of Diaminodinitroethylene (DADE, FOX-7).	
Laser Ignition for Medium Caliber Armaments	
5. g. VOC Elimination Projects (In Ordnance Manufacturing)	61
Primerless RTV Sealants/Adhesives	
Solventless Manufacturing of Propellants using TPE Binder	
Clean Agile Manufacturing of TNAZ	
Supercritical Fluid Processing of Pyrotechnic Binders	
5. h. Other Projects	63
Engineering and Technical Services for JG-PP Projects	
Development, Testing & Evaluation of Functional Fluids for Agricultural Materials	
Ecotoxicity Tests for CW Compounds	
Environmental Fate & Toxicity of CW Related Material	
Material Products Decontamination of BW Agents	
Investigation of Melt Processed Polymer/Clay Nanocomposites: Biodegradable and Recyclable Packaging Items for Solid Waste Reduction	
Spinning of Fibers from Aqueous Solutions	
Munitions Monitoring Using Fiber-Bragg Grating System	
Fluid Sensors	
5. i. Elimination of Ozone Depleting Solvents Projects	69
Continuous Aqueous Cleaning to Eliminate ODC	
Chemistry of Halon Substitutes	
Atmospheric Fate of Halon Alternative Compounds	
Chemical and Physical Processes responsible for Flame Inhibition Using Halon Agents and Their Alternatives	
Hazardous Material (HAZMAT) Alternatives for Turbine Engines	
Non-Ozone Depleting Sealants for Ammunition Applications	
5. j. Reduce Green House Gas Emissions Projects	73
Climate Change Fuel Cell Program	
Casting Emission Reduction Program	
5. k. Advanced Materials Processing Projects	75
Minimization of Uranium Alloy Waste By Electron Beam Melting	76
Alternates to Acid Cleaning of DU Metal Surfaces	
Environmental/Health Effects Evaluation of Alternatives for DU Penetrators	

Lightweight Protective Ceramics
 Aqueous Processing of Fibers and Composites
 Non-Polluting Composite Repair & Remanufacture for Military
 Applications
 Composite and Ceramic Materials Recycling (SGM Subtask R2-4)
 Cylindrical Magnetron Sputtering Target Production/Protection –
 Electro-Cleaning

5. I. Design Tools Projects

79

Identification of Health Effects and Costs Associated with Toxic
 Substances in DOD Workplaces
 Facility Environmental Management and Monitoring System (FEMMS)
 Environmental Cost Analysis Methodology (ECAM)
 Surface Properties and Interactions of Coating Materials
 Green Ammo – MIC Primer Risk Assessment
 Green Gun Barrel – Tantalum Risk Assessment
 Green Processes Simulation – Environmental Lifecycle Model
 Modeling of Fate and Transport of Chemicals
 Demil Disassembly
 General Tasks in Support of Education
 Modeling the Cylindrical Magnetron Sputtering System
 Radford Environmental Development and Management Program
 (REDMAP)
 Erosive Element Interaction with Gun Tube Alloy and Coatings
 Sensor/Modeling Research and Development
 Environmental Management Research and Engineering
 (SGM Subtask R6-1)
 Army and DOD Requirements Lists (SGM Subtask R6-2)
 Mechanisms of Military Coatings Degradation

BLANK PAGE

1. Industrial Ecology Center Mission: The Industrial Ecology Center (IEC), located at Picatinny Arsenal, New Jersey is a principal manager in the Army's Environmental Quality Pollution Prevention Technology Program. The IEC's involvement includes the Army Environmental Quality Basic Research & Development Program (EQBRD), the Sustainable Green Manufacturing (SGM) Program, and the Army Corrosion Protection Program. In addition, a member of the IEC staff participates as the Army representative on the Strategic Environmental Research & Development Program (SERDP) Pollution Prevention (P2) Technology Thrust Area Working Group (TTAWG) to serves on the Pollution Prevention panel of the Environmental Security Technology Certification Program (ESTCP). The IEC is the Technical Oversight office for the DOD National Defense Center for Environmental Excellence (NDCEE) in support of the Executive Agent staff's management duties, is currently the program management office for the Casting Emission Reduction Program (CERP), and provides life cycle environmental support to the Army's armament mission.
WEB SITE: <http://www.pica.army.mil/iec/>

a. Science and Technology Programs:

This program is a technology base development program. It accomplishes basic research and development for the tri-services. It include the EQBRD program, SERD program, SGM program and AMC Corrosion Prevention and Control Program as defined in the following paragraphs:

(1.) Environmental Quality Basic Research and Development (EQBRD) Program

The EQBRD program funds basic research and represents the fundamental science and technology knowledge that will support the more mature advanced development efforts. This \$3.5 M/yr Army program is focused primarily on evaluating feasibility of early technology concepts for pollution prevention in the Army's industrial base. The objectives are to advance the state-of-the-art with respect to pollution prevention and the life-cycle management of hazardous materials and wastes. Our goal is to develop innovative key technologies that will contribute to maintaining readiness by reducing the costs and risks of meeting the Army's long range environmental challenges.

Our investment strategy centers on identifying the waste streams associated with the manufacture, maintenance and disposal of Army unique products and developing basic research projects that will provide the maximum economic return. Given that 85% of the AMC wastes generated are in energetic processing, metal finishing, cleaning/degreasing, and painting, our program targets these critical areas. *The POC for the EQBRD Program is Mr. Tom Sachar (973-724-2364)*

(2.) Strategic Environmental Research and Development Program (SERDP)

The SERDP typically represents technology at the exploratory research level. A small portion of SERDP also addresses basic research via Strategic SERDP Exploratory Development (SEED) Projects. The SERDP was established in November 1990 as a multi-agency program whose participants include the Department of Defense, Department of Energy, and the Environmental Protection Agency. There is also participation by the National Aeronautical & Space Administration, the Department of Interior, and the National Institute for Standards and Testing. The program is currently being funded at approximately \$52 million per year with the Pollution Prevention Pillar receiving approximately 30% of the budget. In FY01 the Army was the lead for \$3.091 million for pollution prevention efforts and is slated for \$2.652 million for FY02. This book will not address efforts under the other three pillars: Compliance, Remediation and Conservation. It also will not address SEED efforts.

The Pollution Prevention R&D program, under SERDP, is structured to address a wide variety of user environmental problems associated with surface protection, energetics, advanced materials, and elimination of ozone depleting chemicals, and life cycle environmental tools to assist weapon systems designers.

The POC for SERDP Program and Environmental Technology Team Leader is Mr. Tom Sachar (973-724-2364).

(3.) Sustainable Green Manufacturing (SGM) Program

The SGM program is an alliance including Armaments Research, Development, and Engineering Center (ARDEC), Concurrent Technologies Corporation (CTC), The New Jersey Institute of Technology and the Physical Science Laboratory at the New Mexico State University are subcontractors under this effort. The program focuses on research in pollution prevention and life cycle environmental issues that impact military systems.

The primary objective of the program is to develop life cycle-based, environmental improvements by conducting research and engineering in:

- Modeling and Simulation
- Environmental Engineering
- Coatings
- Corrosion Prevention
- Demilitarization Technologies
- Effectiveness of Environmental Management Systems

The POC for SGM Program is Mr. Don Skelton (973-724-4071)

(4.) AMC Corrosion Prevention and Control (CPC) Program

The IEC serves as a co-chair of AMC CPC programs with responsibility to develop a Corrosion Prevention and Control (CPC) Program to address the serious concerns for Army weapon systems corrosion. Although corrosion will never be completely stopped, its cost can be significantly reduced. The program objective is to reduce weapon system corrosion maintenance costs. The program has four major aspects: Management Structure, Policy, Communications, and Science and Technology. This objective is to be achieved through a management structure based on the concept of Integrated Product Teams (IPTs) - Corrosion Integrated Product Teams (CIPTs) at all AMC Subcommands - whose efforts are coordinated by the AMC Corrosion Manager (ACM). The CIPTs will be expected to seek participation from relevant program management, industrial, and academic experts familiar with their respective commodities. The science and technology issues, will be addressed by a two pronged attack which will identify, test and implement the latest CPC state-of-the-art practices available in industry and develop, verify, and implement new technologies to reduce corrosion in new and fielded systems.

Effectiveness of the CPC Program will be tracked quarterly, using the following performance indicators: Technology transfers, cost savings, extension of maintenance cycles, funds obligated, funds expended, equipment design modifications, pounds of hazardous materials eliminated, and number of meetings, papers, and training events.

The POC's for the CPC Program are Dr. Joseph Argento, IEC, ARDEC (973) 724-2428 and Mr. John Theis, IEC, ARDEC (973) 724-5795

(5.) Nanocoatings Program:

Use nanotechnology to develop the next generation of "smart" coatings for Army materiel through the use of nanomachines to address the serious concern over weapon system corrosion thereby resulting in longer service life and lower failure rates of current and future weapon systems. This program will Investigate the use of nanomachines for smart coatings development; develop coatings with corrosion-inhibiting and self-healing properties; perform field testing on Army materiel.

b. Demonstration/Validation Programs

Once the feasibility and utility of a key environmental technology concept has been proven and completed, the next step in the R&D process is Dem/Val. This step ensures validation prior to transition to field use. The Environmental Security Technology Certification Program (ESTCP) and the National Defense Center for Environmental Excellence (NDCEE) are two separate programs, established to accomplish this objective:

(1.) Environmental Security Technology Certification Program (ESTCP)

ESTCP's goal is to demonstrate and validate the most promising innovative technologies that target the Department of Defense's (DOD's) most urgent environmental needs and that are projected to pay back the investment through cost savings and improved efficiency. The current cost of remediation and compliance in the Department is significant. Innovative technology offers the opportunity to reduce both costs and environmental risks.

ESTCP's strategy is to select lab-proven technologies with broad DOD market application and aggressively move them to the field for rigorous trials documenting their cost, performance and market potential. Successful demonstration leads to acceptance of innovative technologies by DOD end-users and the regulatory community. To ensure that the demonstrated technologies have real impact, ESTCP incorporates these players in the development and execution of the program. In Pollution Prevention, technology demonstrations led by the Army include a phosphoric acid and sodium hydroxide waste stream recycling effort at Watervliet arsenal, nitrocellulose fines recycling at Radford Army Ammunition plant and target material which could be recycled at small arms firing ranges.

The POC for ESTCP Support is Mr. Tom Sachar (973-724-2364)

(2.) National Defense Center for Environmental Excellence (NDCEE)

was established in 1990 to "serve as a national leadership organization to address high priority environmental problems for the Department of Defense (DoD), other government organizations and the industrial community." The Assistant Secretary of the Army (Installations and Environment) (ASA (I&E)) was assigned to be the Executive Agent in FY 00.

The NDCEE is a source of expert scientific, engineering, laboratory and mini-factory services supporting the environmental technology requirements of DoD activities tasked with facilitating the transition of environmentally acceptable materials, engineering design tools and manufacturing processes to defense industrial activities and training to support their use. The Center features a demonstration factory in which the technologies can be fully demonstrated (excluding energetic materials).

The NDCEE is actively involved in DoD-wide environmental technology and acquisition reform initiatives and is transitioning environmentally acceptable technology to the defense and commercial industrial base. Efforts include alternative coatings, engineering design tools, cleaning, assembly, manufacturing and demanufacturing methods. Significant emphasis is also placed on environmental cost analysis, health risk assessment and technology transfer. WEB SITE: <http://www.ndcee.ctc.com>

The POC at the Industrial Ecology Center for the NDCEE Program is Mr. Mike Wrazen (973-724-3730).

(3.) Casting Emission Reduction Program (CERP)

The CERP is a Federal Government/Department of Defense (DOD) program established to conduct research and development on metal casting technologies, to investigate air emissions, and to investigate foundry product and process improvements in a real-world environment.

CERP's associated work with the American Industry/Government Emission Research project and other domestic and international stakeholder organizations expands the research into emission measurement technologies for both stationary and mobile sources. The Industrial Ecology Center is the Federal Program Manager for CERP.

CERP's mission provides for the evaluation, testing and qualifying possible replacement materials and/or manufacturing processes, as well as the validation testing of both materials and instrumentation for the reduction of hazardous emissions from both stationary and mobile sources. CERP initiatives include research involving lightweight casting materials and processes, such as titanium and thin-wall iron, for application to defense programs important to the Army's Transformation efforts.

CERP accomplishes this mission by conducting metal casting research and development to evaluate the ability of alternate products and processes to reduce emissions generated during the production of castings. CERP also develops emission measurement technology improvements for stationary and mobile sources, foundry safety and pollution process improvements, and accomplishes technology transfer and outreach to the DOD, its contractors, and the casting user community.

CERP is a key DOD program to sustain and enhance our nation's technical capabilities and to provide leadership in technology innovations in the Casting and Foundry industry. For additional information, please visit the CERP website at www.cerp-aiger.org/.

The POCs at the Industrial Ecology Center for the CERP Program are Mr. Garry Kosteck or Mr. Lawrence Pasterick (973-724-6755/7540).

3. FY02 New Starts

TITLE: Development of Membrane Technology for Food and Water Monitoring

PROJECT Nos.: 3.5.c

PROGRAM FUNDING SOURCE:
EQBRD

PERFORMING LAB: Natick Soldier Center, Natick, MA

OBJECTIVE: To develop both biosensor detection platforms and membrane concentrators to improve sensitivity and real-time detection of chemical pollutants, bacterial pathogens and toxins.

APPROACH: Generate high surface area membranes with covalently attached Molecular Recognition Elements. This will increase the probability of finding and detecting analytes of interest present at low concentrations. Select polymer for use in high surface area membrane. ID specific MRE's for membrane association. Using Green Chemistries, fabricate high surface area membrane. Characterize and select MRE's and polymer membranes for sensor applications.

PROPONENT: Army

POC: Dr. Andrej W. Miziolek

PHONE: (410) 306-0884

STATUS: Initiated

FAX: (410) 306-1909

TITLE: Computational Model Development for Improved Solid Waste Reduction

PROJECT Nos.: 3.D-057CL

PROGRAM FUNDING SOURCE:
Army 6.1 EQT

PERFORMING LAB: US Army Research Laboratory, Aberdeen Proving Ground, MD

OBJECTIVE: Conduct a two-year study of the laser plasma phenomenon to provide fundamental understanding of the processes that are responsible for the generation of the analyte signal from various contaminants that the LIBS sensor detects.

APPROACH: Develop a CFD model of the LIBS plume, which is physically faithful to the laser-generated plasma event. The CFD code is based on a solution of the unsteady, Navier-Stokes equations including species diffusion, thermal conduction, viscosity, and nonequilibrium chemical kinetics.

PROPONENT: Army

POC: Dr. Andrej W. Miziolek

PHONE: (410) 306-0884

STATUS: Initiated

FAX: (410) 306-1909

TITLE: Nanomachines in Smart Coatings

PROJECT No.: AH28

PROGRAM FUNDING SOURCE: Army 6.2 RDT&E

PERFORMING LABS: U.S. Army Industrial Ecology Center and the New Jersey Institute of Technology

OBJECTIVE: Develop the next generation of "smart" coatings for Army materiel through the use of nanomachines to address the serious concern over weapon system corrosion thereby resulting in longer service life and lower failure rates of current and future weapon systems.

APPROACH: Investigate the use of nanomachines for smart coatings development; develop coatings with corrosion-inhibiting and self-healing properties; perform field testing on Army materiel.

PROPONENT: Army

POC: Ms. Laura Battista

PHONE: (973) 726-5650

STATUS: Initiated

4. Green Programs

TITLE: Materials and Processes Partnership for Pollution Prevention (MP4) Program
PROJECT Nos.: 3.M-027 -N227) **PROGRAM FUNDING SOURCE:** Army
6.2 EQT

PERFORMING LAB: NDCEE

OBJECTIVES: Develop, demonstrate and validate pollution prevention cost saving technologies for the DoD acquisition, sustainment and industrial base, thereby reducing hazardous material usage, reducing regulatory pressure, and lowering the cost of weapon systems throughout their life cycle.

APPROACH: Identify pollution prevention technologies and management solutions to address DoD needs. Establish goals and technical requirements necessary to satisfy need. Develop, test, and demonstrate technology and management solutions including cost and health risk impacts. Transition new technologies and processes to the Army industrial base and other DoD and commercial sites.

PROPONENT: Congress

POC: Mr. Robert Moreira,/Mr. Robert Zanowicz IEC

PHONE: (973) 724-2617/5744

STATUS: Ongoing

FAX: (973) 724-6759

TITLE: Demanufacturing of Electronic Equipment for Reuse and Recycling (DEER2) Program

PROJECT Nos.: 3.D-050 (N.072) **PROGRAM FUNDING SOURCE:** Army 6.2
EQT

PERFORMING LAB: NDCEE

OBJECTIVE: Develop, demonstrate and validate new technologies and processes for the reuse, recycle, or disposal of manufactured electronic equipment used by the DoD and its suppliers. The Electronic Equipment Demanufacturing Program will be implemented in Largo, Florida. This site will allow access to source of raw materials to aid in the demonstration and validation of the developing technologies.

APPROACH: Identify and analyze DoD needs to establish goals and requirements for the DEER2 Program. Establish an Electronics Demanufacturing Technology and Demonstration Program in which technologies can be fully demonstrated and validated including training to DoD personnel. Use and Integrated Product Team (DLA, DoD Working Group, TACOM-ARDEC, IEC, CECOM/TYAD, CTC) approach to ensure satisfaction of DoD technology needs and program goal accomplishment.

PROPONENT: Congress

POC: Mr. Robert Moreira, IEC

PHONE: (973) 724-2617

STATUS: Ongoing

FAX: (973) 724-6759

TITLE: Sustainable Green Manufacturing Program

PROJECT Nos.: 3.D-051

PROGRAM FUNDING SOURCE: Army 6.2
EQT

PERFORMING LAB: Industrial Ecology Center, NDCEE, NJIT & NMSU

OBJECTIVE: Develop life cycle-based, environmental improvements by conducting research and engineering in: modeling and simulation, environmental engineering, coatings, corrosion prevention, demilitarization technologies, and the effectiveness of environmental management systems.

APPROACH: The program is divided into three program management tasks and six research tasks. Specific tasks have been identified for execution through teaming of Industrial Ecology Center, National Defense Center for Environmental Excellence, New Jersey Institute of Technology & New Mexico State University. The team will sponsor seminars and workshops, and generate handbooks, that describe the technology. Conduct environmental engineering studies for coatings, corrosion prevention, environmental management systems, life-cycle cost and health effects, and demilitarization technologies required for environmental improvements. The program will provide direct support to various green programs, Corrosion Protection and Control, Predictive and Life Cycle Environmental Modeling, develop environmentally friendly Non-destructive Inspection Technologies, and Smart Sensor and Packaging Technologies.

PROPONENT: Congress

POC: Mr. Don Skelton, IEC

PHONE: (973) 724-4071

STATUS: Ongoing

FAX: (973) 724-6759

TITLE: Green Gun Barrel Program (Roll up)

TITLE: Elimination of Aqueous Electrodeposition of Chromium for Gun Barrel Bore Protection

PROJECT Nos.: 3.A.2-027 (SERDP PP1074-98)

PROGRAM FUNDING SOURCE:
Multiple

PERFORMING LAB: TACOM/ARDEC

OBJECTIVE: Provide an alternative, less polluting process and/or materials to chromium electroplating for bore protection in gun barrels.

APPROACH: Develop a process using chromium, tantalum, et al. based on Cylindrical Magnetron Sputtering (CMS) techniques. The CMS process has virtually no hazardous waste products and eliminates the need for any mitigation equipment. The work package includes the development of a medium caliber gun barrel magnetron sputtering laboratory facility, coating of tubes with various refractory materials and testing of the coatings. The work will be leveraged with efforts funded under the Future Tank Main Armament Program and will allow for scale-up to large caliber gun tubes. This effort also builds upon work funded under the ARMY 6.1 EQT 6.1 work package titled Target Technology Development for Coatings.

POC: Michalel Audino , ARDEC/Benet Labs
PHONE: (518) 266-5740

STATUS: In Progress
FAX: (518) 266-4661

TITLE: Green Bullet Program (Roll-up)

PROJECT Nos.: 3.D-052 (SERDP PP1074-98)

PROGRAM FUNDING SOURCE:
Multiple

PERFORMING LAB: TACOM/ARDEC

OBJECTIVES: Applied Research, Development, Demonstration/Validation and EO12856 funded efforts addressing pollution prevention and life cycle environmental issues that impact tri-service small caliber ammunition.

APPROACH: The list of pollutants and the sources have been identified and projects identified according to maturity of technology needs for achievement of pollution reduction goals and expected benefits. Total program extends from inception of initial needs with FY93 funding provided under SERDP and extends out to FY03. Being addressed are substitutes for: lead/antimony in bullet projectile core, barium nitrate, antimony sulfide and lead styphnate in primer, heavy metals in tracer and incendiary formulations, ODC's and VOC's in the manufacturing processes and materials.

5. Project Summaries

5. a. Cleaning and Degreasing Projects

TITLE: Aqueous Based Degreasing Technology

PROJECT NUMBER: 3.A.1-003

PROGRAM FUNDING SOURCE:

Army 6.1 EQT

PERFORMING LAB: U.S. Army Natick Research, Development & Eng. Center, Natick, MA

OBJECTIVE: Develop nonpolluting, nontoxic water-based degreasers for cleaning metal/glass/plastic surfaces using biopolymer, emulsifying materials.

APPROACH: Develop microbially produced natural surfactants (emulsions) through fermentation processes and optimize chemical structure of the new materials for specific oil/grease removal needs. Solve production issues for fermentation and purification of new bioemulsifiers. Relate detergency to chemical structure. Tailor chemical structure of bioemulsifiers for specific degreasing applications. Extramural: modify bioemulsifiers by fermentation feeding strategies. Chemically characterize new emulsifiers. Modify other similar biopolymers with fermentation technique. Optimize bioremediation methods for emulsified oil/grease solutions.

PROPONENT: TACOM/AMCOM/OSC

POC: Dr. Kevin McGrath, Natick

PHONE: (508) 233-4266

STATUS: Completed

FAX: (508) 233-5104

TITLE: Microbial Cleaning

PROJECT NUMBER: 3.A.1-018 (R2-12)

PROGRAM FUNDING SOURCE:

Army 6.2 EQT/SGM

PERFORMING LAB: NDCEE

OBJECTIVE: Develop a microbial cleaning process that will eliminate the use of hazardous materials in the AGT 1500 turbine engine.

APPROACH: Anniston Army Depot (ANAD) currently performs maintenance activities associated with the M1 Combat Tanks. Specifically, the maintenance activities include the cleaning of bearing housings and spacers in the rear module of the Engine. These components contain holes that are small and become plugged with carbonized synthetic oil residue, which could result in catastrophic failure. The current cleaning process is a multi-step method utilizing hazardous materials. Microbial cleaning can replace the cleaning material with a non-hazardous biological microbial media, which will significantly reduce the generation and management of hazardous waste. Also, the implementation of a microbial washer has the potential to greatly increase the cleaning efficiency of the parts by enabling the microbes to be exposed to the carbonized materials reducing the probability of engine failure due to air or fluid flow blockage.

PROPONENT: Army, Navy, Air Force

POC: Mr. Don Skelton IEC

5. b. Plating and Finishing Projects

TITLE: Removal of Cyanide-Bearing Processes

PROJECT NUMBER: 3.A.1-019 (N.227 Sub Task 012)

PROGRAM FUNDING

SOURCE: Army 6.2EQT/SGM

PERFORMING LAB: NDCEE

OBJECTIVE: Reduce or eliminate the use of cyanide from the metal stripping and finishing facilities at Corpus Christi Army Depot (CCAD) and transfer knowledge gained to other DoD facilities.

APPROACH: Identify, demonstrate, validate, justify and implement removal of cyanide-bearing processes at CCAD. Perform preliminary testing required to qualify alternative chemistries for implementation at CCAD. A five-step approach will be used: perform a requirements analysis, identify alternatives, conduct technology demonstration, provide technology justification, and technology implementation.

TITLE: Ion Beam Processing for Improved Corrosion Protection

PROJECT NUMBER: 3.A.2-021(R4-1) **PROGRAM FUNDING SOURCE:** Army 6.2
EQT/SGM

PERFORMING LAB: NDCEE

OBJECTIVE: Develop in-house capability to provide coatings using the Ion Plater and the Ion Beam Processing System. Characterize those coatings, and compare similar coatings applied by the different methods.

APPROACH: DoD and industry alternatives or enhancements to chromium electrodeposits and other finishes will be investigated. Coatings will be applied using the Ion Plater and the ion beam processing system. The resistive evaporation, cathodic arc, and sputtering sources of the Ion Plater and the electron beam evaporators and low energy ion sources of the ion beam system will be used to deposit such coatings. The high-energy source of the ion beam system will be used to modify the surface of chromium electrodeposits.

Several vacuum processes will be identified with potential for cadmium replacement. The most promising will be implemented and evaluated as fastener coatings. A follow-on program will then be developed to assist in implementing the most successful alternative in Army repair depots.

TITLE: Self-Assembled Monolayers (SAMs) as Primers for Corrosion Protection for Metallic Substrates & Spectroscopic Studies of Primer Alternatives.

PROJECT NUMBER: 3.B.3-012

PROGRAM FUNDING SOURCE:

Army 6.1 EQT

PERFORMING LAB: Army Research Laboratory, APG, MD

OBJECTIVE: To prepare and characterize SAM coatings on steel and aluminum surfaces; to study the corrosive and oxidative resistance of the SAM coatings, and to identify the optimal coating characteristics with respect to metal protection, durability, ruggedness, ease of application, and longevity.

APPROACH: This project will be a collaborative effort between Aerodyne Research, Inc. (ARI) and the Army Research Laboratory (ARL). ARI will perform the synthesis of appropriate long-chain hydrocarbons for use as SAM coatings on steel and aluminum; the preparation, characterization, and testing of the SAM coatings; and the synthesis of terminal air-interface groups and chain modified materials for cross-linking and multi-layer SAM coatings. ARL will perform the FTIR and Raman characterization of chemical and morphological changes in SAM films due to exposure to common solvents, acidic and alkali solutions, and corrosive gases. In addition, ARL will conduct photochemical cross-linking studies of SAM coatings as well as characterize the structure and chemical resistance of multi-layer coatings.

TITLE: Paint Handling & Spraying Equipment Testing, Evaluation and Training

PROJECT NUMBER: 3.B.2-006 (N.023)

PROGRAM FUNDING SOURCE: Army

6.2 EQT

PERFORMING LAB: NDCEE

OBJECTIVE: Evaluate and test advanced paint handling and spray equipment for use in military industrial facilities that will reduce environmental discharges associated with painting operations, comply with EPA regulations, and improving productivity. The NDCEE will act as a non-biased third party to evaluate the various technologies against the DOD requirements using latest industry innovations.

APPROACH: First, a requirements analysis was undertaken. This will involve DOD specification owners, DoD end users, paint handling and spray equipment vendors, paint manufacturers and commercial users. These groups were assembled into committees, which will then be used for the information survey. Technologies that have the biggest benefit were identified and demonstrated first. Certification test programs were developed and carried out to ensure that the technologies meet all DoD and EPA requirements and specifications. A paint handling and spray technology information database was established and made accessible to the DOD and commercial industry. The NDCEE has established a training center that will allow for economical training of personnel.

PROJECT NUMBER: 3.B.2-008 (R4-1)

PROGRAM FUNDING SOURCE: Army
6.2 EQT/SGM

PERFORMING LAB: NJIT/NDCEE

OBJECTIVE: To work with military industrial facilities to evaluate and implement pollution prevention technologies in corrosion control efforts by applying environmentally compliant organic coatings.

APPROACH: Commercial technologies are available that can potentially protect military aircraft, vehicles, and weapons systems against corrosion. Testing, validation, training, system specification, and implementation support to military industrial facilities in their efforts to eliminate pollution will be provided. Military facilities will be assisted to develop a user-friendly, object-oriented database that will allow the tracking of vehicles to collect cost data related to corrosion, the performance of corrosion control measures, and other pertinent data about the systems.

TITLE: Supercritical CO₂ Painting Demonstration

PROJECT NUMBER: 3.B.2-003 (R3-1)

PROGRAM FUNDING SOURCE: Army
6.2 EQT/SGM

PERFORMING LAB: NDCEE

OBJECTIVE: The objective is to establish the capability to spray paint with the UNICARB CO₂ system. As a result of this effort, the NDCEE will have established a demonstrative platform for DOD users to investigate this paint spraying method in reducing the volatile organic compound (VOC) emissions from painting operations.

APPROACH: Procure a license agreement with Union Carbide for the right to conduct research and developmental activities with the UNICARB CO₂ painting technology for DOD. Procure a production size painting system that uses the UNICARB technology. The painting system will be large enough for job shop activities, yet small enough to conduct developmental activities. Train CTC personnel on the technology, operation, and maintenance of the painting system. Conduct a spray demonstration.

TITLE: X - Ray Sorbing/Scattering Structural Characterization

PROJECT NUMBER: 3.B.2-001 (R4-2)

PROGRAM FUNDING SOURCE: Army
6.2 EQT/SGM

PERFORMING LAB: NJIT

OBJECTIVE: Determine the nature of the interactions between steel substrates and both metal and non-metallic coatings. A further goal is to develop rapid procedures to recognize early states of corrosion in order to facilitate development of field-able techniques leading to repair and maintenance on an as needed basis.

APPROACH: The proposed work will utilize X-ray techniques to determine the nature of the interactions between steel substrates and both metal and non-metallic coatings. Predictive issues to be considered are bonding strengths, permeability, and interfacial characteristics. The goal is to predict and assess the ability of alternative protective coatings to perform as well as present coatings such as chromium. A primary initial focus will be on use of tantalum coatings in gun barrels and the corrosion protection ability of such coatings.

TITLE: Evaluation, Qualification, and Implementation of Powder Coating for Tobyhanna Army Depot (TYAD)

PROJECT NUMBER: 3.B.2-012 (R4-2)

PROGRAM FUNDING SOURCE: Army
6.2 EQT/SGM

PERFORMING LAB: NDCEE

OBJECTIVE: Implement Powder Coat Technology at Tobyhanna Army Depot (TYAD)

APPROACH: As a DOD Industrial Painting Facility, TYAD has been tasked to reduce/eliminate VOC and HAP emissions associated with current coating processes. Powder coating is an industry-proven technology that offers the potential to eliminate VOC and HAP emissions. In 1993, TYAD expressed interest related to implementing a powder coating process but was restricted by funding issues. This effort will identify candidate parts and performance requirements to lead to the implementation of a powder coating process by providing equipment purchasing, installation, training, and start up support.

5.d. Paint Stripping Projects

TITLE: Waterjet Paint Stripping

PROJECT NO: 3.B.4-004 (93 SERDP) **PROGRAM FUNDING SOURCE:** SERDP

PERFORMING LAB: TACOM, Warren MI

OBJECTIVE: To eliminate or significantly lower the generation of hazardous and toxic materials during metal surface pretreatment. Ultimately this will reduce the cost of painting in manufacturing and in Depot repair.

APPROACH: Combine state of art robotics with Waterjet paint stripping and simultaneously apply an aqueous based non-hazardous material that will produce a continuous barrier between the metal oxide and primer paint. The effect will be to use all of the above new technologies into a single operation that is environmentally acceptable.

TITLE: Tri-service Dem/Val FLASHJET Process for Military Application

PROJECT No: 3.B.4-006 (N.126)

PROGRAM FUNDING SOURCE:
ESTCP

PERFORMING LAB: AEC.

OBJECTIVE: To demonstrate and validate xexon flash lamp technology to remove organic coatings from airframes, landing gear and ground vehicles.

APPROACH: Xexon flashlamp technology or Flashjet, developed by McDonnell Douglas now part of Boeing, is a state of the art paint removal system. The system removes paint rapidly and produces no additional hazardous waste stream while having no effect on the substrate. This is important due to thin aluminum and composite skins, which comprise airframes. Boeing's test facility in Mesa, AZ has successfully demonstrated this technology on the Army's Apache Helicopters. The thrust of this particular effort is expanding the testing to Navy and Air Force Rotary Aircraft and Army ground combat vehicles.

TITLE: Paint Stripping Using CO2 Pellets

PROJECT No: 3.B.4-002 (N.045)

PROGRAM FUNDING SOURCE: Army 6.2
EQT

PERFORMING LAB: NDCEE, Naval Aviation Depot, Jacksonville.

OBJECTIVE: Demonstrate and validate the mobile manipulation of an advanced CO2 Turbine wheel, for paint stripping using CO2 pellets and then integrate it into production in an actual depot

APPROACH: System uses solid CO2 pellets as abrasive mediums to strip paints and surface coatings off metal parts. This has the advantage of having no waste medium (such as sand) to add to the hazardous waste stream. The pellets are cylindrical and are fed through a turbine wheel where they are accelerated to a high rate of speed. When striking the surface they shatter the paint and the pellets evaporate. An advanced pelletizer was obtained in November 1997 and is 90% efficient compared to a 50% efficiency of the first generation model. The newest phase of the project is to integrate this technology into a production work cell by stripping paint off of engine containers.

TITLE: Adams Process Evaluation

PROJECT No: 3.C.3-001C (N.042)

PROGRAM FUNDING SOURCE:

Army 6.2 EQT

PERFORMING LAB: NDCEE

OBJECTIVE: Development of a technology based on a patented process using high temperature reaction involving liquid and gaseous sulfur (Adams Process) as an alternative to open burning of hazardous wastes.

APPROACH: A patented chemical process that uses molten/vaporized sulfur at ambient pressure and high temperature (150 C - 500 C) for destroying oxygenated and halogenated compounds. Project evaluated the following wastes: Nitrocellulose, nitroglycerin propellant M30, Fuse containing lead azide, Composition B - an explosive containing RDX and TNT, malathion a surrogate for chemical agent GB and polychlorinated biphenyls (PCB).

Computer modeling and bench scale testing showed that the target waste streams are essentially destroyed to greater than 99.9999%. A pilot plant to destroy 1 kg/hr of chemical agent surrogate would cost a little less than \$1M. A large amount of sulfur containing by-products would be produced. There is a need for additional experimental follow-on work for a soundly based pilot plant design.

FAX: (973) 724-3162

TITLE: Extraction/Recycling of Triple Base Propellants with Supercritical Fluids

PROJECT No: 3.C.1-016

PROGRAM FUNDING SOURCE:

Army 6.1 EQT

PERFORMING LAB: ARL, Aberdeen Proving Ground, MD

OBJECTIVE: To investigate solubility and reactivity of triple-base propellant nitro guanidine (NQ) and nitroglycerin (NG)] in supercritical fluids (SCFs).

APPROACH: It is believed that amines like NQ will be incompatible with SC CO₂, due to carbonate formation. Since CO₂ is the usual SCF of choice, it is necessary to confirm this reaction and the conditions under which it occurs. Assuming that CO₂ cannot be used with NQ, a concerted theoretical and experimental investigation will be made of the solubility (phase diagrams) of NQ and NG in alternative SCFs (e.g., ethane, ethylene, fluoroform). SCF extraction will also be compared to "gas anti-solvent re-crystallization" techniques for NQ.

PROGRAM FUNDING SOURCE: Army
6.2 EQT/SGM

PERFORMING LAB: NDCEE

OBJECTIVE: Evaluate the performance of the granular activated carbon (GAC) process at Milan AAP and Iowa AAP to improve process parameters.

APPROACH: Currently, there are three government owned, government operated and eleven government owned contractor operated Army depots, arsenals, and or plants (AAPs) in the United States. Most of these sites generate pink water during load, assembly, and packing and demilitarization operations. Pink water contains hazardous contaminants that are toxic and photochemically active. Previously, the process was evaluated at NDCEE and put in use at Milan AAP. However, due to low production levels, the process appears inefficient generating waste at a quicker rate, increasing disposal costs. It is planned to add the use of microbes that are grown under thermophilic conditions and then added to the pink water treatment system. The process is currently being demonstrated at Iowa AAP.

TITLE: Solventless Manufacturing of Propellants using TPE Binder

PROJECT No: 3.C.4-002 (B045)

PROGRAM FUNDING SOURCE:
SERDP

PERFORMING LAB: Naval Air Warfare Center, China Lake and TACOM/ARDEC, Picatinny Arsenal, NJ

OBJECTIVE: To provide a demonstration of solventless processing of a Thermoplastic Elastomer (TPE) polymeric system for artillery propellant. To develop new energetic materials and processes necessary to eliminate or greatly reduce both VOC production and ancillary waste through enhanced DEMIL and recyclability.

APPROACH: To utilize technology initially developed, in conjunction with ARL, for a LOVA tank propellant and currently being investigated under a follow-on technology-base program to develop a high performance, i.e. TNAZ, RDX or CL20 TPE tank propellant. To provide maximum VOC elimination, artillery propellants will be formulated for Unicharge based on TPE elastomeric binders. These propellants must have characteristics similar to M30 for Unicharge to function properly. Production of the candidate propellants initially will be by batch extrusion. Both molecular modeling and advanced chemical diagnostics will be used to optimize the propellant. The propellant will be tested in Unicharge gun firings to optimize performance. Continuous twin-screw extruder processing will be developed for the most promising candidates.

5.h. Other Projects**TITLE:** Engineering and Technical Services for JG-PP Projects**PROJECT Nos.:** 3.D-046 (N.272)**PROGRAM FUNDING SOURCE:** Tri-Service
Customer Funded**PERFORMING LAB:** NDCEE

OBJECTIVE: Provide engineering, technical, management, and business support to the Joint Acquisition Sustainment Pollution Prevention Activity (JASPPA), which is chartered by the Joint Group on Pollution Prevention (JG-PP) to reduce or eliminate hazardous materials (HAZMATS) by fostering joint service and NASA cooperation to avoid duplication of effort. The focus is on design, manufacturing, re-manufacturing, and depot maintenance process locations that affect DoD and NASA systems.

APPROACH: Engineering and technical services are provided in support of the JG-PP pollution prevention efforts, which concentrate on defense contractors with multiple defense contracts, for multiple services, and multiple program managers. A methodology developed by the JASPPA is used for identifying, evaluating, selecting, and implementing candidate JG-PP projects, and support is provided in managing, coordinating, and facilitating project execution. A comprehensive performance specification (Joint Test Protocol), reflecting minimum engineering/performance requirements and pass/fail criteria for qualification of alternative processes/materials, is developed in coordination with affected stakeholders for each JG-PP project. Affected stakeholders monitor and /or participate in joint testing and contribute an adjudicated share of project costs. The block change mechanism under the Single Process Initiative (SPI) is used to implement the approved, validated change(s) simultaneously on multiple affected contracts. Depot sustainment maintenance activities will utilize their respective service/agency mechanism for implementation.

PROPONENT: Joint Group on Pollution Prevention (JG-PP)**POC:** Mr. L. M. Pasterick, IEC**PHONE:** (973) 724-7540**STATUS:** Ongoing**FAX:** (973) 724-6759

5. i. Elimination of Ozone Depleting Solvents Projects

TITLE: Continuous Aqueous Cleaning to Eliminate ODC

PROJECT No: 3.E-001

PROGRAM FUNDING SOURCE:

SERDP

PERFORMING LAB: OSC, Rock Island Arsenal, IL

OBJECTIVE: To develop non-ODC metal parts cleaning process for use prior to painting.

APPROACH: Validate an aqueous based cleaning system for degreasing metal parts at Rock Island Arsenal prior to the application of a chemical agent resistant coating (CARC). A three-step approach will be followed. First the aqueous based cleaner will be selected to replace 1,1,1-trichloroethane, which is an ODC. Secondly equipment specifications and purchase descriptions including wastewater treatment requirements will be developed. Lastly the most feasible alternative will be installed.

TITLE: Chemical and Physical Processes Responsible for Flame Inhibition Using Halon Agents and Their Alternatives.

PROJECT No: 3.E-008 (E219)

PROGRAM FUNDING SOURCE:

SERDP

PERFORMING LAB: Army Research Lab, APG, MD

OBJECTIVE: The goal of this research project is to develop a detailed flame chemistry computer model which will not only predict the relative flame extinguishment properties of new Halon alternative compounds, but also will identify the possible formation of toxic flame products resulting from the use of the agents(s).

APPROACH: The basic approach involves a tightly coordinated research program of flame model development coupled with experimental verification. The flame experiments involve the use of a low pressure burner apparatus which contains a premixed laminar flow flame. We use the Tunable Diode Laser (TDL) absorption technique for flame profile studies. The detailed chemical flame mechanisms are tested on the basis of agreement with the experimental results. The detailed kinetic models are based on accurate knowledge of thermodynamic and kinetic properties of the relevant species and reactions.

FAX: (410) 306-0640

TITLE: Hazardous Material (HAZMAT) Alternatives for Turbine Engines

PROJECT Nos.: 3.E-032 (N.240)

PROGRAM FUNDING

SOURCE: USAF

PERFORMING LAB: NDCEE

OBJECTIVE: Eliminate all Class I Ozone Depleting Chemicals (ODCs), reduce the use of EPA-17 chemicals and comply with NESHAP requirements to limit the emissions of Hazardous Air Pollutants (HAPs) and Volatile Organic Compounds (VOCs) cited in turbine engine technical orders (T.O.s) used to specify the operation and maintenance of weapon systems. The current task addresses T.O.s for engines used on Cruise Missiles, as well as Air Force Aircraft F-4, C-141, KC/EC-135, B-52, E-3, B-2, U-2S, F-15, F-16 and B-1B. Previously completed tasks addressed engines used on C-5A/B, A-10, and B-2 Air Force aircraft, as well as numerous Army aircraft.

APPROACH: Turbine engine technical orders and first-tier military/OEM specifications are screened to identify all references to the use of targeted HAZMATs. A Chemical Process List is created to include each reference to the targeted HAZMATs and the page and paragraph number of the T.O. where each reference occurs. The application-specific requirements are identified and analyzed to establish the minimum acceptable conditions or requirements that will satisfy operation/performance objectives. Alternatives to the use of HAZMATs are identified, evaluated and qualified. Results are published for use by the government in implementing T.O. revisions. If required, complete T.O. revision documentation can be provided to facilitate the updating of T.O.s for publishing and distribution.

TITLE: Surface Properties and Interactions of Coating Materials

PROJECT NUMBER: 3.M-013 (R1-5)

PROGRAM FUNDING SOURCE: Army
6.2 EQT/SGM

PERFORMING LAB: NJIT

OBJECTIVE: Develop an atomic level model to predict deleterious interactions with atmospheric and environmental agents.

APPROACH: This is in response to the continuing Army need for longer lasting organic coatings with increased resistance to environmental challenges and increased adhesion to substrates. The quality of a paint spray coating is intricately related to atomization conditions occurring during paint spray. Atomization depends on gun design, paint characteristics and paint spray process conditions. A quantitative understanding of the effects of gun design (orifice size), paint characteristics and parameter settings on atomization will allow optimization of spraying conditions to achieve desirable atomization and coating quality. The model will construct coating surfaces based on atomistic electronic properties using density functional and/or ab initio level calculations. The model will be designed to predict the results of interactions with active species, such as ozone, hydroxyl radicals, acidic liquids, SO_x, and NO_x. The predictions from the model are expected to provide opportunities for structural modifications of coating materials leading to longer lifetimes.

PROGRAM FUNDING SOURCE: Army 6.2
EQT/SGM

PERFORMING LAB: NJIT

OBJECTIVE: Qualitatively assess the human health and environmental risks of implementing the use of tantalum and tantalum sputtering in support of green gun barrel manufacturing. The focus is to qualitatively assess hazard, exposure, human health risk, and ecological risk to support risk-based decision-making and assure that risks are reduced for workers.

APPROACH: Conduct a qualitative risk assessment to characterize human and ecological risks associated with the use of tantalum and tantalum sputtering as a green gun hexavalent chromium electroplating) to the use of the tantalum sputtering alternative will be completed to document potential health threats and determine which process will adequately protect worker health.

TITLE: Green Processes Simulation - Environmental Lifecycle Model

PROJECT NUMBER: 3.M-020 (R1-1)

PROGRAM FUNDING SOURCE: Army
6.2 EQT/SGM

PERFORMING LAB: NJIT

OBJECTIVE: Develop modeling and numerical simulation capability for materials processing applications.

APPROACH: Adaptation of a process engineering methodology, integration of existing hardware and software systems, and implementation of an initial set of priority process examples for the purpose of establishing a computer-based framework to model and simulate green process engineering and management. Goal is to develop an integrated approach for design, manufacturing, use and disposal of environmentally sound products. Pollution prevention, treatment of pollutants, and the potential for reuse will be accounted for while maintaining the specifications and standards necessary for the highest quality of the product. Useful approaches for risk modeling and comparison for human health implications exist and are used in determining potential impacts of various environmental scenarios including economic implications. A key initial activity is the examination of one manufacturing operation at the Iowa Army Ammunition Plant with the initial objective of developing a protocol for prioritizing chemicals for use reduction based on environmental costs. The longer-term goal will be to use the data as a key part of the simulation development process for the total lifecycle of the ammunition product.

TITLE: Modeling of Fate and Transport of Chemicals

PROJECT NUMBER: 3.M-021 (R1-4)

PROGRAM FUNDING SOURCE: Army 6.2
EQT/SGM

PERFORMING LAB: NJIT

OBJECTIVE: Develop risk modeling that will give a good capability for comparing ecological risks.

APPROACH: The goal of this project is to develop a general Ecological Risk Model (ERA) which can be applied to a broad range of problems. The ultimate goal is to provide a tool that can be used by the Army to facilitate informed decision making about product and process design to optimize lifecycle environmental costs for weapon systems. Additionally, the tool should be useful for environmental decision making for emission management and remediation activities.

TITLE: Demil Disassembly

PROJECT NUMBER: 3.M-022 (R5-1)

PROGRAM FUNDING SOURCE: Army 6.2
EQT/SGM

PERFORMING LAB: NJIT

OBJECTIVE: Conduct research leading to the identification and development of new process or methods applicable to the relatively new area of final disposition. The proposed effort will be focused on the area of development of tools applicable to design for de-manufacturing.

APPROACH: Activities leading to decision support tools specific to design of military products from the perspective of decommissioning and demilitarization will be carried out. Issues to be considered are efficient and effective metrics and guidelines, assembly and disassembly process simulation, and enhanced production data management for disassembly planning. It is planned to conduct this activity in the context of design of a new "green bullet" component.

TITLE: General Tasks in Support of Education

PROJECT NUMBER: 3.M-023

PROGRAM FUNDING SOURCE: Army
6.2 EQT/SGM

PERFORMING LAB: NDCEE

OBJECTIVE: Conduct continuing research related to environmental awareness training.

APPROACH: A team of environmental/economic educators and an expert in the area of computerized data collection, analysis, and presentation will work with the investigators of each of the technical research areas, in the Sustainable Green Manufacturing Program, to monitor the research results for incorporation into training packages. The team will consider, through interviews and appropriate participation in CTC and government training activities, optimum opportunities to incorporate the findings and perspectives into modified training activities. While the team will be involved in each of the individual research elements, they will be expected to gain an overview perspective of the entire program and to incorporate that broad view into the training instruments developed. The activities of the team will be described in each of the monthly reports and they will assist the investigators of each technical research element in preparing the required reports and technology transfer/transition applications.

TITLE: Modeling the Cylindrical Magnetron Sputtering System

PROJECT NUMBER: 3.M-024

PROGRAM FUNDING SOURCE:
Army 6.1 EQT

PERFORMING LAB: Benet Labs

OBJECTIVE: Develop capability to model the best target-annulus-substrate configuration for cylindrical magnetron sputtering (CMS) system.

APPROACH: Required are plasma models, collision models, cellular automata and statistical thermodynamics. Utilization of CMS required to eliminate high costs resulting from the mitigation of environmental impacts of chromium plating..

PROJECT NUMBER: 3.M-025 (N.125/225) **PROGRAM FUNDING SOURCE:** Army
6.2 EQT

PERFORMING LAB: NDCEE, Johnstown, PA

OBJECTIVE: To install a real time Environmental Management and Monitoring System at Radford Army Depot. Identify high priority P2 and environmental monitoring /control needs based on cost and compliance. Implement pollution prevention technologies and ISO 14000.

APPROACH: Build on the knowledge of the environmental management and monitoring system at Tobyhanna AD. Utilize an integrated product team to ensure customer satisfaction. Make maximum use of off-the-shelf hardware and software to reduce costs and technical schedule/quality risks. Promote technical data exchange and demonstrate to other interested parties.

TITLE: Sensor/Modeling Research and Development

PROJECT NUMBER: 3.M-029 (R1-1)

PROGRAM FUNDING SOURCE: Army
6.2EQT/SGM

PERFORMING LAB: NDCEE

OBJECTIVE: Develop a smart structure system that will increase the life-span of helicopter blades, lessening the environmental impact of manufacturing (resins and composite materials).

APPROACH: The concept under development is to develop the Fiber-Bragg Grating (FBG) sensors to measure strain, deformation, force, and vibration in the AH-64 (Apache) Helicopter. Optical fiber sensors bring a number of unique advantages for smart structures that cannot be achieved by conventional strain gauge systems. Specifically, the sensors can be multiplexed along a single fiber to give indiscreet, distributed measurements throughout an entire structure. Conventional data collection methods have proven unreliable resulting in low data quality.

TITLE: Environmental Management Research and Engineering

PROJECT NUMBER: 3.M-030 (R6-1)

PROGRAM FUNDING SOURCE: Army
6.2 EQT/SGM

PERFORMING LAB: NDCEE

OBJECTIVE: Facilitate the deployment of an ISO 14001/CEMP compliant complete Environmental Management System (EMS) at DID sites as well as other Federal agencies.

APPROACH: The DOD recently concluded a two-year pilot program that evaluated the use of the International Organization for Standardization's (ISO) EMS standard, Environmental Management Systems Specification with Guidance for Use (ISO 14001). The results of the DOD Pilot Program baseline and pilot studies suggest that while the DOD has many of the requirements of a conforming EMS, critical elements of a complete EMS are missing and implementation of existing elements within installations is uneven. Federal Agencies, including DOD, have until the year 2005 to implement a complete EMS.

TITLE: Army and DOD Requirements Lists

PROJECT NUMBER: 3.M-031 (R6-2)

PROGRAM FUNDING SOURCE: Army
6.2 EQT/SGM

PERFORMING LAB: NDCEE

OBJECTIVES: Establish cooperative endeavors among both defense and commercial industrial entities focusing on Army needs and NAFTA's environmental requirements in conjunction with ARMY 6.2/SGM partners and other DOD representatives. Demonstrate the use of commercial practices to produce military acceptable products, specifically evaluating cost efficiencies realized through single process utilization. Identify raw material use, manufacturing processes, intermediate processes, waste generation/disposal issues, and regulatory enforcement issues related to industries along the border. Identify processes and products that are in common with the US-Mexico private sector manufacturing and the DOD for which IEC/CTC/NJIT could develop environmentally friendly alternatives.

APPROACH: This is a continuation of a current effort to develop an Army and DOD requirements list applicable to ARMY 6.2/SGM efforts and make comparisons of DOD requirements with those of private sector manufacturers along the US-Mexico border.

TITLE: Mechanisms of Military Coatings Degradation

PROJECT No: 3.B. (SERDP PP1133-99)

PROGRAM FUNDING SOURCE:
SERDP

PERFORMING LAB: ARL, Aberdeen Proving Ground, MD

OBJECTIVE: Pollution prevention via extended coating durability. Identify modes and primary factors to understand military coatings degradation. Establish priority of significant factors. Establish confidence in degradation modes and test protocols. Provide formulation recommendations for improved performance of topcoats, primers and substrate protection by tech transfer to suppliers.

APPROACH: Validate models, develop independent models and sub-models, modes and mechanisms to end up with a usable predictive model, quantify degradation mechanisms UV oxidation and corrosion to yield a kinetic model and toolbox to track changes.
